

Automatic lubrication for packaging machine:

Proper lubrication ensures optimum performance and long life of machinery. Packaging machines and automatic packaging lines as a whole can guarantee long-term high performance standards if certain mechanical parts, in contact with one another as they move, are adequately lubricated. This applies – for example – to chains, bearings, gears, bushings and kinematics. However, simply lubricating is not sufficient; you need to use the right lubricant at key pivot points as and where required, accurately and specifically: neither too much, nor too little. With the focus firmly on production, packaging line maintenance personnel often fail to effectively carry out the above-mentioned basic operation, especially when this would involve even just a temporary shutdown

- Greater reliability of mechanical parts
- Far fewer after sales problems
- Massive reduction in downtime

- implemented both on each new packaging machine
- Installed on existing machines (retro-fit option).
